Program: Tutte

Course: Tutte

Legend

Item	Description
05	The instructor is clear and effective in explanations.
06	The instructor is able to interact with students.
07	The instructor stimulates interest in the course subject.
08	Teaching aids (lecture notes, slides, articles, etc.) are adequate.
09	Lectures are well organized (contents, program structure, time-table, coherence

STUDENTS OBSERVATIONS - TEACHING ACTIVITIES

ECONOMETRICS 2 (MICROECONOMETRICS)

FANKHAUSER

- Very good TA, sometimes a bit too fast speaking - but Martin was great. Good slides, open to suggestions, nice additions (bootstrap etc).
- The teaching assistant is highly motivated and very available in terms of office hours. The exercises added to the problem sets were not very clearly phrased. All other material is good.
- The notation and language of the problem sets should really be improved, as it is very confusing and leads to misunderstandings and errors. I like the fact that TAs are used to dig deeper into selected topics, but I would rather that being done in class and then in a TA we can see more applications of the methodologies.
- Problem sets should be better written, sparking less confusion about the objective of questions. Just think of how many times we had to contact you to clarify questions, that's a signal that either the question was too confusing or the notation was sloppy. Also, solutions many times were incomplete, some missing chunks of code or explanations. I suggest trying to solve the PSs yourself again to see if everything is clear and/or accounted for in the solutions, or asking a colleague to proof-read it. Also, many of them were way too long and exhausting to make, reducing our overall motivation for the course.
- I think Martin is a very good TA. He is knowledgeable and it's clear he is very interested in econometrics. Regarding the sessions, I liked that it alternated one week of solving psets with another week of discussion on more advanced topics. The only thing I would change is maybe going deeper into the concepts of the psets rather than solving the exercises per se since we can always look into the solutions on our own (or maybe only solve the more difficult exercises so there is time remaining to review the concepts and spend more time on things that we say quicker in lectures.)
- I think it would be better to have shorter problem sets, and consequently more time for actual TA classes that go more in depth on the lecture topics, rather than just reviewing so many exercises (some of whom were actually truly challenging and so did need time to be explained and corrected).
- I guess it would be better if Martin can improve the way of presenting in class. e.g. when introducing new materials in class, would be better if can slow down a bit and explain things more in detail. Also when talking about the solutions of the problem sets, would be better if can leave some time for people to write down the solutions and not erase things on board so fast. Other than that, overall he's responsible and helpful.

- The slides are a great resource to have for the future, but I think the sessions could cover a lesser amount of topics, so it doesn't feel rushed. I'd say keep the slides as they are, but choose a few important parts to present and show more examples of them, code implementations or papers.
- The lecturer is very passionate and knowledgeable, as is obvious from the good materials he prepares and detailed feedback he always provides. He also is very available for questions and cares about students learning. However, the lecturer is not clear and the lectures are not well structured in the sense that he moves through explanations too fast, and is not open to constructive criticism, specifically students asking to amend the pace. Also, while it is understandable given his passion, the lecturer could avoid showing contempt towards students (in class, at exam reviews), as it is somewhat unprofessional and unconstructive.
- The instructor is unable to take feedback from students with an open mind: as a whole class, we as a class didn't like when we asked him to slow down and he said "you should've said it during class". Problem sets are poorly written and many times we have to spend a lot of time to figure out what the question is asking, both in theoretical and applied parts. Theoretical questions asking to use
