Academic Career Statement

I am completing my PhD in Economics at Bocconi University and aim to pursue a research-oriented academic career in econometrics. My research develops identification and inference methods for settings in which the available information is incomplete or conventional assumptions are difficult to justify. It spans partial identification, Bayesian econometrics, and forecasting, with an emphasis on methods that applied researchers can use. During the Max Weber Fellowship, I plan to develop two projects on uncertainty in probabilistic expectations surveys and rank–rank regressions with missing incomes, laying the groundwork for an independent research programme.

The Programme's Academic Practice Activities would be especially valuable in the transition from completing doctoral research to establishing a sustained publication record. I would use the *Draft Publication* process, *Writers' Groups*, and individual feedback on academic writing to turn working papers into journal submissions. Since my work combines technical econometric results with empirical applications, feedback on exposition and presentation would help me communicate its assumptions and implications more effectively, including to researchers outside my immediate field. The interdisciplinary exchanges at the EUI would also help me identify new settings in which robust inference can contribute to substantive economic questions.

Teaching is an important part of my academic career plans. Over four academic years at Bocconi, I have delivered lectures and problem sessions in PhD microeconometrics and macroeconometrics, alongside teaching-assistant work at the undergraduate and master's levels. My approach emphasizes careful derivations, computational illustrations, and the limitations of empirical methods, and my teaching has received strong student evaluations. I would particularly value the *MWP Certificate in Teaching & Learning in Higher Education* to move from teaching individual sessions towards designing and assessing complete courses. Its emphasis on course design, inclusive teaching, peer observation, and supervised teaching practice would help me develop a reflective teaching portfolio.

My longer-term objective is a faculty position combining methodological research with econometrics teaching. The *Academic Job Skills Workshop Series* and individual consultations would help me refine research and teaching materials, job talks, and interview skills for different academic markets. I would also participate in the *Grants in Focus Conference* to learn how to develop competitive research proposals and, over time, seek independent funding. The Max Weber Programme offers an unusual combination of research time, structured feedback, and academic-practice training at precisely the stage when I am preparing for an independent academic career.
